SUMMARY

ML systems engineer (B.Tech CSE, 2026) and sole author of four manuscripts. I build ML systems from scratch and benchmark them against the leaders: kernels at **cuBLAS** parity, an LLM engine matching **vLLM** token for token, and a tokenizer beating **GPT-4o's**.

OPEN-SOURCE IMPACT: SIX FIXES MERGED IN 11 DAYS, 16–26 OCT 2026

- **Apple MLX** (Apple's ML framework for Apple silicon, **29k★**): fixed a data race in the backend linking Macs for distributed training (ThreadSanitizer: 2–4 races per run → **0**); reviewed, approved and merged by MLX maintainer @zcbenz. #4737
- **Meta ExecuTorch** (on-device AI in Instagram, WhatsApp and Ray-Ban Meta, **5.1k★**): closed an out-of-bounds read in the quantized embedding kernels of on-device LLMs; approved by Meta's Scott Roy ("LGTM! Thanks for the fix!") and Jacob Stevens. #23677
- **JaxMARL** (NeurIPS 2024, **868★**; BOLD Lab: Oxford, UCL & Imperial): fixed the rollouts behind 8 Q-learning baselines, which zeroed each new episode's first observation; approved and merged by lead author Alex Rutherford: "Good find!!" #206
- **Oxford PyZX** (quantum-circuit optimiser, **553★**): fixed a rewrite that broke **25 of 100** random Clifford circuits; merged by co-creator John van de Wetering: "Thanks for the fix! This was a regression from an earlier PR." #563
- **Hugging Face OpenEnv** (RL environments backed by Meta-PyTorch, Hugging Face, NVIDIA and Microsoft, **2.8k★**): fixed reward rubrics that ran hooks out of order and scored async judges as coroutines; reviewer: "177 rubric tests pass." #1441, #1442
- **In review:** Google JAX (**36.5k★**; Google assigned it to JAX co-author Matthew Johnson), vLLM (**95.7k★**), NVIDIA, PyTorch, MIT, Carnegie Mellon, ETH Zurich.

RECOGNITION

- **NASA CARA** (NASA's conjunction-assessment team): its Operations Team Lead referred my independent reproduction of CARA's Monte Carlo collision probabilities (**53/53** cases, **15–19×** faster per core) to its analysts for review (20 Oct 2026; emails).
- **Entrepreneur First** (UK): its Talent Investor scouted me from public work alone, citing tessel's cuBLAS-parity GEMM, switchyard's MoE serving and a negative result I published, "which I rarely see" (email).

RESEARCH

- Sole author: **"Removing the Token Tax from an Existing Model"**, **"The Sampler Was Not the Policy"**, **"Reproducing NASA CARA's Monte Carlo Probability of Collision"** (arXiv, forthcoming).

PROJECTS

ratchet — PyTorch, C++/CUDA: RL post-training (GRPO) from scratch · study page
- Lifted Qwen2.5-0.5B on GSM8K from **48.1% to 52.5%** in 100 steps on 2× T4, scoring all 1,319 test problems.
- Cut weight sync **369×** with in-place GPU updates, and made steps **1.9×** faster by overlapping generation with training.
- Found fp16 weight sync silently erasing most updates, so the sampler ran a policy the trainer never had (gap **5.2 → 0.04** nats).

tessel — Rust: a tile language and compiler for GPU and TPU kernels · study page
- Wrote a Triton-style compiler: tile IR, tensor-core CUDA (mma.sync, ldmatrix, pipelining), auto-tuning, Metal and TPU backends.
- Matched **cuBLAS** on GEMM (**1.00–1.04×**) and beat PyTorch SDPA on causal attention (**1.3–1.9×**) on a T4, checked against fp64.
- Built an LLM engine on these kernels alone that matches **vLLM token for token at 1.05× its throughput** (TinyLlama-1.1B).

lipi — PyTorch: cutting the token tax on Indian languages · study page
- Built a tokenizer that needs fewer tokens than **GPT-4o's and Gemini's in 23 of 24** Indian languages (on Hugging Face).
- Extended Qwen2.5-0.5B with it: Odia takes **8.6×** fewer tokens and, in equal GPU time, is predicted **20% better**.

samebit — C, CUDA, PyTorch, MLX: integer-only LLM inference with the same bits on every chip
- Made **six independent backends** (C, NumPy, PyTorch, **Apple MLX**, **CUDA**, reference) give **one SHA-256 digest over 153 tensors** on x86-64, ARM64 and an **NVIDIA T4**.

More projects
- **relay**: fault-tolerant LLM serving on custom kernels, prefill **8.7×** faster, **384/384** requests identical through 60 kills.
- **syndrome**: GPU quantum decoder bit-identical to **IBM's**, **28.7×** faster per shot; **kessler**: matches **NASA CARA** on 53/53.
- **switchyard**: MoE serving **2.2×** Hugging Face; **kiln**: beats torch.compile on CPU; **crucible**: **0 of 9** reward hacks pass.

EXPERIENCE

Gigzen — Co-founder & Founding Engineer **Apr 2026 – Present**
Early-stage startup (name approved by India's MCA; incorporation in progress) · Sole engineer
- Built Waggle, three Android delivery apps on one PostgreSQL backend: **53 tables, 90 RLS policies, 154 SQL functions**; **150 attacks**, all blocked.
- Moved dispatch, UPI reconciliation and GST billing into the database, so no client can bypass them.

SKILLS

ML systems: PyTorch, JAX, MLX; GRPO, DDP, ZeRO/FSDP, MoE expert parallelism, paged KV cache, int8 quantization
Languages & GPU: Python, C++20, CUDA (tensor cores), Rust, C, Swift, SQL; Triton-style kernels, Metal, Pallas (TPU)

EDUCATION

B.Tech, Computer Science and Engineering (AI & ML) — IEM Kolkata **Sep 2022 – Apr 2026**
